MARSHALL SERVICE BULLETIN

SUBJECT: Bias Info/Procedure for JCM2000 series Marshall amplifiers

THEORY OF OPERATION: We are setting the bias using the current method instead of cross over distortion method. The Bias PCB assembly is as follows:

PR1: Bias mini-pot adjustment for pin1 which is one side of the push pull amp (two output tubes in a 100watt amp and one output tube in a 50watt amp).

Pin1: Connected to the cathode of the output tube(s) which then goes through a 1 ohm resistor then to ground.

Pin2: ground reference.

Pin3: Same as pin1 but for the other side of the push/pull amp.

PR2: Bias mini-pot adjustment for pin3, the other side of the push/pull amp.

PROCEDURE:

1. Make sure amplifier is connected to a load with the proper impedance selected.
2. Power up amplifier on STANDBY and let the circuit stabilize for a couple of minutes.
3. Locate the male three pin molex connector (CON2) with the two mini-pots (PR1 and PR2) on both ends found on the bottom of the tube bay.
4. Connect DMM (set to read mV) with alligator leads, reference common lead to center pin (pin2) on molex connector CON2 and positive lead to pin1 on CON2.
5. Take amplifier off of STANDBY with no signal, adjust mini-pot (PR1) closest to pin that the positive lead from your DMM is connected to and set it to the mV voltage that is listed in the chart below.
6. Repeat steps 4 & 5 for pin3 and until both pin1 and pin3 mV are the same.

BIAS CHART mV SETTINGS

(pin1 and pin3)

DSL50	45mV	TSL60/1/2	80mV
DSL100	90mV	DSL401	1.375V
TSL100/122	90mV	DSL201	.675V

FAQ

However, I can tink some light and decided to add my own SF VibroChamp a feather reverb, and to be honest, have the Amp (IMHO) made a little gig amp perfect for Fender training or.

We may, in your sole discretion, charge fees for your payment method individually or in total for any or all of your paid services with us.. In 1973, Marshall switched to circuit boards (no point-to-point wizards), which meant the end of an era, but not the end of the classic Marshall tone.. Finally the amplifier on a concert completely paved way and I was lucky that my keyboard was played by a Bassman 70 and I could use him as he went right.. Of course, you must always be careful, but at the same time, I think that 95 or more of the people out there are basically credible and some correspondence with the seller can help you get a feel for the person. The base amplifier was in a very untouched condition, so he needed only a full-cap job, new valves, a few changes in the signal cap, new grill bag, extra reverb tank, spare speaker and good general cleanup.. So I would start there If you find the tone you looking for, but you need it to play higher, you can use your microphone and drive it through PA to make it as high as you need it for the public.
